

2020

AUSTRALIA'S
GENDER
HEALTH TRACKER

A brief report card on preventable chronic diseases,
conditions and their risk factors by gender
Tracking progress towards a healthier 2025

Males are more likely than females to:

Consume fewer fruit and vegetables

Be overweight/obese

Drink at 'risky levels'

Females are more likely than males to:

Feel depressed

Have higher levels of anxiety

Live with more than two chronic conditions

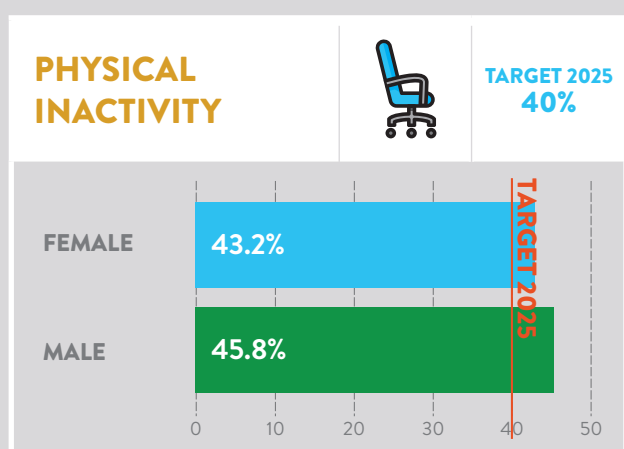

Regardless of gender, greater investment into the shared risk factors unhealthy diet, physical inactivity, smoking and harmful use of alcohol is vital

Gender matters in policy and practice

AUSTRALIA'S GENDER HEALTH TRACKER – 2020

This report card looks at the health of Australian women and men in relation to health risk factors and chronic diseases. Australia's Gender Health Tracker is a companion report card and should be read in conjunction with the Australia's Health Tracker 2019.

We have known for a long time that women and men experience unique health concerns. On average, Australian women tend to live longer compared to men but are likely to live with multiple chronic conditions. Men, especially young men, often engage in risky health behaviours and die prematurely from injury rather than living with disease.

This gender disparity is not unique to Australia. Countries with reliable health data collection also report that women live longer than men.

The purpose of this report card is to graphically highlight how women and men's health needs are different and that policies and services must recognise gender as a significant factor in health risk and outcomes.

An earlier (2015) report produced by the Mitchell Institute highlighted that current policy, funding and service models are failing women and therefore having serious impacts on social and economic consequences including unemployment, reduced productivity and increased costs of healthcare and welfare. We must also make sure that men live better.

52%
OF FEMALES

48%
OF MALES

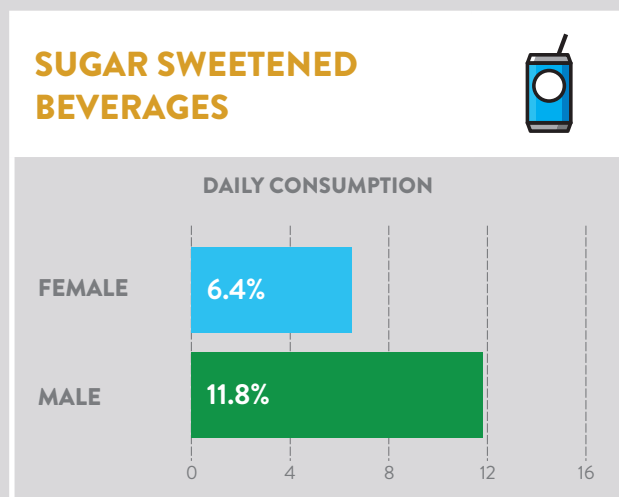

have at least one chronic disease

Males and females
HAVE DIFFERENT HEALTH NEEDS

DISADVANTAGE
is associated with poorer health outcomes for **MEN** and **WOMEN**

Future health policy should apply
A GENDER LENS

The recent release of the National Women’s and Men’s Health strategies will provide a platform to drive improvement in the health and wellbeing of men and women in Australia. Both strategies also recognise the importance of the multiple areas of intervention points and opportunities at each life stage for health promotion, illness prevention, early intervention and treatment as well as promotion of self-care.

Regardless of gender, it is vital to address the shared and modifiable risk factors for chronic disease: unhealthy diet, physical inactivity, smoking and harmful use of alcohol. These risk factors can and do lead to increased levels of chronic disease and higher risk of early death from preventable causes.

Improvement and commitment to these areas, with a gendered approach across the life course, should be a priority for future health policies.

The 2025 targets for a healthier Australia have been developed through the collective effort and guidance of Australia’s leading scientists, researchers and clinicians.

A gendered approach on future health policy and practice will benefit every one, address the gender disparities and improve health and societal outcomes.

The Australian Health Policy Collaboration led by the Mitchell Institute for Education and Health Policy works with and supports a collaborative network of organisations and leading chronic disease experts, bringing together Australia's leading thinkers to translate rigorous research into good policy.

The national collaboration has developed health targets and indicators for 2025 that together, will reduce preventable chronic diseases and reduce the health impacts of chronic conditions.

Australia's Health Tracker and Getting Australia's Health on Track are the policy focussed reports compiled by the national collaboration. Australia's Gender Health is the latest report card as part in the Australia's Health Tracker series.

More than 50 organisations continue to support a systemic and sustained approach to the prevention and management of chronic diseases in Australia.

Australia needs a healthier future for all. We can, and we must, do better.
